(School of Chemistry and Chemical Engineering, Chongqing University, Chongqing 400044, China)

ABSTRACT: Objective To in-situ fabricate self-collected Ni(OH)₂ supercapacitor electrode materials with excellent capacitance and good cycle stability by a facile, cost-effective and green method. **Methods** The hydrothermal treatment of Ni foam was performed in a 15wt. % H₂O₂ solution at 180 °C for 24 h to in-situ fabricate Ni(OH)₂. The morphologies, phase composition and electrochemical performance of the as-prepared Ni(OH)₂ electrode material were characterized. **Results** The β-Ni(OH)₂ hexagonal platelets with the side lengths of 400 ~ 600 nm and the thickness of ~200 nm were obliquely laid on the Ni foam at high densities. The electrode demonstrated excellent capacitance (2534 F/g at a scan rate of 1 mV/s) and good cycling stability (91% ca-

pacitance retention after 1000 cycles at a scan rate of 50 mV/s) in 2 mol/L KOH aqueous solution. **Conclusion** The fabrication method developed here was facile, cost-effective and green. The as-prepared binder-free, self-collected electrode material exhibited remarkable electrochemical performance with high specific capacity and good cycling stability.

KEY WORDS: Ni(OH)₂; hydrothermal method; in-situ fabrication; supercapacitor

超级电容器^[1],又被称为电化学电容器,具有可快速循环充放电、功率高、寿命长等优点,在移动电话、计算机和电动汽车的混合电源等诸多领域都有广泛应用^[2~7]。目前,超级电容器的研究主要集中于开发具有高比容量的活性材料。Ni(OH)₂由于环境友好、价廉、来源丰富等优点,成为一种非常具有应用前景的新型赝电容电极材料,近年来在超级电容器领域受到了广泛关注^[2~4,8~9]。目前Ni(OH)₂电极材料的制备主要通过两种方式实现:一种是将Ni(OH)₂制备成纳米粉体,与导电剂、粘结剂混合后,压制于集流体上,制成电极^[5,10~11];另一种是以薄膜的形式,直接将Ni(OH)₂负载在集流体上作为电极使用^[12~13]。前一种制备方法不仅工艺复杂,而且由于粘结剂的添加,导致内阻大,比容低;后一种方法制备的电极材料,活性物质与集流体之间的结合力弱,导致组装的超级电容器循环寿命较短。由此可见,如果能采用合适的方法直接在集流体上原位生长Ni(OH)₂活性物质,从而制备自支撑、自集流且电化学性能和循环稳定性优良的超级电容器电极材料,对于解决目前Ni(OH)₂电极材料存在的问题具有重要意义。

文中通过双氧水水热处理泡沫镍,直接在泡沫镍集流体上原位生长Ni(OH)₂活性物质,并对其形貌、组成、电化学性能等进行了表征和研究。

1 实验

1.1 材料制备

剪取2.0 cm×6.0 cm的泡沫镍(纯度99.99%,厚1.0 mm,孔径为110PPI)作为水热原材料,依次在三级水、无水乙醇、丙酮及一级水中超声清洗10 min,在60 ℃条件下真空干燥12 h,得到干燥样品。

将洁净的泡沫镍放入盛有30 mL 15% (质量分数) H₂O₂溶液的反应釜中超声10 min,使溶液充分润湿泡沫镍,然后在180 ℃水热24 h。待反应釜自然冷却到室温后,取出样品,用三级水清洗,在60 ℃真空干燥12 h,即获得Ni(OH)₂为活性物质的自集流电极材料。

1.2 材料表征及性能测试

使用Zeiss Auriga聚焦离子/电子双束扫描电镜(FIB-SEM)以及Zeiss LIBRA 200透射电镜(TEM)对材料进行形貌表征。使用X'pert PRO X射线衍射仪(XRD)对材料进行相组成分析,条件为:Cu靶,K α 线,扫描范围20°~80°。

电化学测试使用PGSTAT302N AUTOLAB电化学工作站。采用传统的三电极体系:制备的电极材料作为工作电极,3 cm×3 cm铂片作为对电极,Hg/HgO电极作为参比电极。电解液为2 mol/L KOH溶液。循环伏安(CV)测试的电压窗口为0~0.8 V,扫速分别为1,2,5,10,25 mV/s;恒电流充放电测试电压窗口为0~0.6 V,电流密度分别为0.5,1,2,5,10 A/g;循环稳定性测试的扫速为50 mV/s,循环次数为1000圈;阻抗(EIS)测试的振幅为5 mV,频率范围为10⁻²~10⁵ Hz。

2 结果与讨论

2.1 形貌及组成

图1为泡沫镍水热后的微观形貌照片。如图1a所示,泡沫镍支架比较粗糙,说明水热过程中有物质在泡沫镍表面原位生长。由图1b可见,新生成的物质为规则六边形片,厚度约为200 nm,竖直排列在泡沫镍表面,这种排列方式能够降低接触电阻,提高电解液与电极之间的电荷转移速率,有利于提高材料的电化学性能^[14]。为了更清楚直观地确定六边形片的尺寸,进行了TEM分析,如图1c所示,水热过程中生长的六边形片边长为400~600 nm。

图2为泡沫镍水热后的XRD分析结果。除了泡沫镍基底的衍射峰(JCPDS No. 04-0850)外,在2θ为19.6°,33.4°,38.8°,52.2°,59.2°,62.7°处出现了新的衍射峰。将这些衍射峰与六方晶型β-Ni(OH)₂的标准谱图(JCPDS No. 14-0117)对照,峰位吻合,由此可以确定,水热过程中生长的六边形片为六方晶型β-Ni(OH)₂,各衍射峰分别对应于β-Ni(OH)₂的(001),(100),(101),(012),(110),(111)晶面。

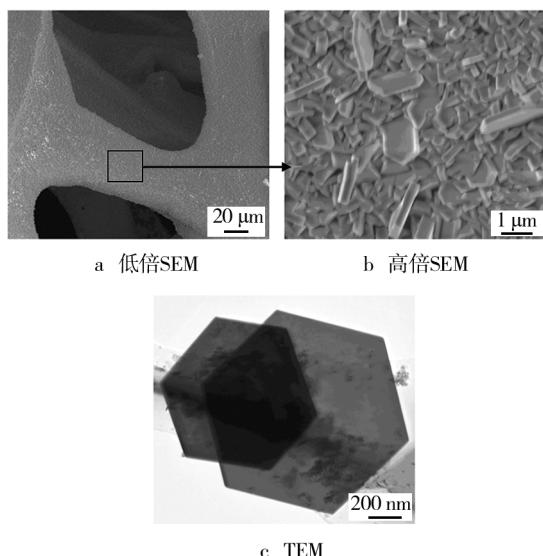

图1 电极材料的形貌

Fig. 1 Morphologies of as-prepared electrode material

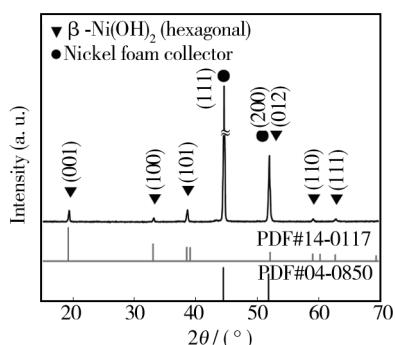

图2 电极材料的XRD图

Fig. 2 XRD patterns of as-prepared electrode material

2.2 电化学性能

图3a是水热制备的Ni(OH)₂电极材料在不同扫速下的循环伏安曲线,这些曲线均有一对氧化还原峰,对应的法拉第反应如下^[14-16]:

随着扫速的增加,峰电流逐渐增大,阳极峰位略微正移,而阴极峰位略微负移,但CV曲线的形状并未发生明显变化。经过计算^[14,16-17],扫速为1,2,5,10,25 mV/s时的Ni(OH)₂活性物质的比容值分别为2534,1884,1295,1082,692 F/g。

为了进一步研究制备的电极材料的电化学性能,还进行了恒电流充放电测试,图3b是该电极材料在不同电流密度下的充放电曲线。经过计算^[14,16-17],电流密度为0.5,1,2,5,10 A/g时的Ni(OH)₂活性物质的比容值分别为1934,1422,1086,833,740 F/g。

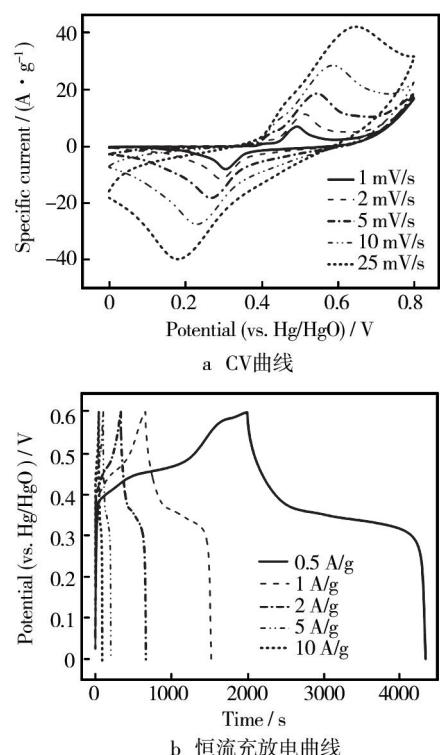

图3 电极材料的电化学测试结果

Fig. 3 Electrochemical performance of as-prepared electrode material

循环稳定性是评价超级电容器电极材料性能的一个重要指标。图4是制备的电极材料在50 mV/s扫速下循环1000圈的结果。可以看到,在开始阶段,比容值随着循环次数的增加而逐渐增加,这是由于循环测试过程中,电解液逐渐渗透到Ni(OH)₂六边形片之间,从而使电极材料充分活化。随着循环次数的进一步增加,比容值稍有降低,循环1000圈后,比容保持率为91%,说明该电极材料具有较好的循环稳定性。

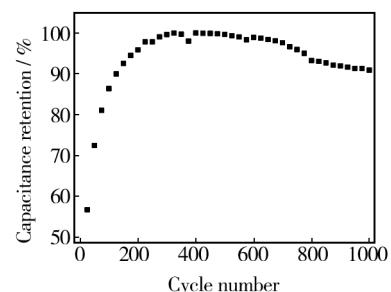

图4 电极材料的循环稳定性测试结果

Fig. 4 Cycle stability of as-prepared electrode material at a scan rate of 50 mV/s for 1000 cycles

图5为制备的电极材料的阻抗图谱。经过拟

合^[14,16-17],可以得到等效串联电阻 R_s 约为 0.24Ω ,说明活性物质自身电阻、电解液电阻以及接触电阻的总电阻值很小,材料具有很好的导电性;电荷传递电阻 R_{ct} 约为 0.02Ω ,说明 Ni(OH)_2 活性物质在参与电化学反应时的电荷传递阻力非常小,有利于反应的进行。

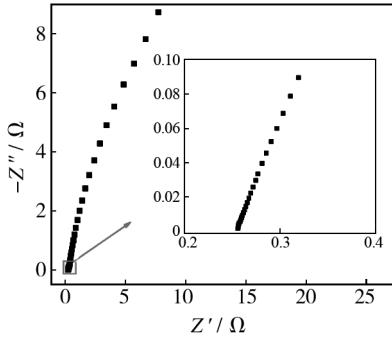

图5 电极材料的阻抗测试结果

Fig.5 EIS spectrum of as-prepared electrode material

3 结论

1) 采用简单价廉、对环境友好的双氧水水热法处理泡沫镍,可以在泡沫镍集流体上原位生长出边长为 $400\sim600\text{ nm}$ 、厚度约为 200 nm 的六方晶型 $\beta\text{-Ni(OH)}_2$ 六边形片,作为自支撑、自集流的 Ni(OH)_2 超级电容器电极材料。

2) 该电极材料具有优异的比容性能以及良好的循环稳定性:在 2 mol/L KOH 溶液中的最高比容为 2534 F/g (扫速为 1 mV/s),且循环 1000 圈后,比容值仍保持在 91% 以上(扫速为 50 mV/s)。
